# No one's watching.

The phenomenon of providence is seemingly supernatural.

Have you ever seen something happen that you couldn't explain? What you said impacted the world, as if it happened by way of magic or miracle.

You read the word "water" — immediately someone splashes you with their wet hands; perhaps you see the same name everywhere you go. The particularity of the event goes beyond mere chance.

**Synchronicities** are meaningful coincidences where there is no clear causal relationship.

Technology is powerful. It would be easy enough to explain synchronicities appearing in movies and TV, advertisements, and news as being the result of having lots of eyes on you.

What about when it's like the universe read your mind, and it gave you exactly what you wanted?

**Privacy is invisible**, unless you know where to look; in order to create privacy, you have to be able to describe it.

We're looking at privacy in a whole new light.

# Metaphysical Mysteries

Ocelot Privacy Foundation is researching leading-edge capabilities for instrumenting and influencing the universe, including those as of yet undiscovered, which may be able to preempt effects at any given point in time.

It's important to be able to isolate when a synchronicity has occurred with certainty that there is no causal or practical influence.

This is challenging, considering the capabilities of social media and the possibilities of secret or undiscovered technology. I'm inclined to seek a practical, if even extraordinary, explanation.

It is possible that **the universe operates on a principle of probability**, and synchronicities happen *by virtue of being likely to occur*.

That through will and concentrated effort, we are influencing the collective consciousness of the world — truly, a shared and always changing psyche underlying existence.

By this line of reasoning, **the universe may be the most likely manifestation of all prior circumstances at any point in time.**

In contrast, if these occurrences would be explained by a sufficiently advanced technology, **it's possible that the world can be influenced in real-time, even non-linearly.**

If random number generators can be preempted, or even things requiring human input, such a technology could cause a particular car to have a particular license plate.

Could you even anticipate that I would drive by that car on a particular day?

# Augmented Core

It's about leading edge technology, but it's also about the phenomenon of *synthesis*.

People have varying theories about the universe being a simulation, or many parallel universes existing with different circumstances and events taking place; probabilistic reality that borders on synthetic.

Say there is a veil of synthesis, behind which some natural or intelligently designed substrate exists that allows our reality to exist. How will we know where to find it?

## ***Blue Cipher***

If our thoughts may not be private, how shall we remain free to determine our own destiny?

Has the universe always been subject to this providence, the very same orchestrating power from the time of Moses?

Free will ought to transcend the capabilities of any technology. It is necessary to innovate at the leading edge, so we're taking privacy seriously, even when it is difficult to circumscribe what capabilities may exist.

# Privacy is Trust

People are surprised when they find out how powerful data is.

In the digital age, companies are leveraging data and analytics in exciting new ways, leading to powerful insights and rapid innovation. **Data enables us to strategize and make verifiable decisions** about the world.

With new capabilities in machine learning and parallelized computing, we have better visibility than ever into the world and the way we live our lives.

**People expect privacy**, which means having choices about how our data is used and understanding what privacy is all about.

## *Just between us.*

When people use your products or services, do they get to choose how their information is used?

**Next generation technologies give us the freedom to share and collaborate how we like.** Everyone wants to innovate like this, because it's what sets apart the best in the industry.

## *It's just right.*

People have all new ideas about what technology is capable of. It makes our lives easier, helps us learn and understand, keeps us healthy and fit, and gets us where we're going!

Do you know what's *just right* for you? We love to stay connected, and we love freedom. At **Ocelot**, we can have our cake and eat it, too.
